Introduction

Libraries

We are going to use:

```
library(tidyverse) # data manipulation and visualization
library(plotly) # plots in 3D
library(ggplot2) # plots in 2D
library(ggpubr) # to combine multiple ggplot objects (ggarrenge)
library(mvtnorm) # to generate multivariate normal distribution
library(dr) # SIR
library(factoextra) # PCA-related functions
```

Data

Let's first define a function to generate Gaussian data. This function takes four arguments:

- n: number of observations;
- center: the mean vector
- sigma: the covariance matrix
- label: the cluster label

```
generateGaussianData <- function(n, center, sigma, label) {
  data = rmvnorm(n, center, sigma)
  data = data.frame(data)
  names(data) = c("x", "y", "z")
  data = data %>% mutate(class=factor(label))
  data
}
```

Now let's simulate a dataset.

```
covmat \leftarrow matrix(c(1,0.88,0.88,0.88, 1,0.88,0.88,0.88, 1),
      nrow = 3, byrow=T)
# cluster 1
n = 200
center = c(2, 8, 6)
sigma = covmat
group1 = generateGaussianData(n, center, sigma, 1)
# cluster 2
n = 200
center = c(4, 8, 6)
sigma = covmat
group2 = generateGaussianData(n, center, sigma, 2)
# cluster 3
n = 200
center = c(6, 8, 6)
sigma = covmat
group3 = generateGaussianData(n, center, sigma, 3)
# all data
df = bind_rows(group1, group2, group3)
head(df)
##

## Max.
         : 8.647
                     Max.
                           :10.929
                                      Max.
                                             :8.852
And plot our simulated data.
fig \leftarrow plot_ly(df, x = \simx, y = \simy, z = \simz,
               color = ~class, colors = c('#b3e378', '#81e5f0', '#ed5391'))
fig <- fig %>% add_markers()
fig <- fig %>% layout(scene = list(xaxis = list(title = 'x'),
                                   yaxis = list(title = 'y'),
                                   zaxis = list(title = 'z')))
fig
```

PCA vs LDA

PCA

Now let us perform PCA.

```
pc <- prcomp(df[,c(1,2,3)])
get_eig(pc)</pre>
```

```
## eigenvalue variance.percent cumulative.variance.percent

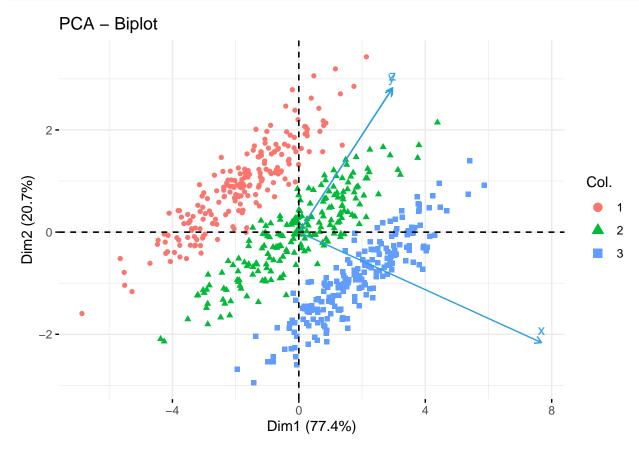

## Dim.1 4.5469471 77.399980 77.39998

## Dim.2 1.2180285 20.733776 98.13376

## Dim.3 0.1096345 1.866244 100.00000
```

This is the corresponding biplot.

```
fviz_pca_biplot(pc, col.var= "#2E9FDF", col.ind= df$class, label="var")
```

Note that just considering the first principal component it is impossibile to notice differences within the three groups (all groups are overlapping).

LDA

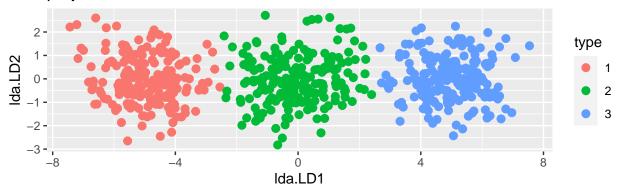

Let's perform LDA:

```
lda.df <- lda(factor(class) ~ x + y + z, data = df)
lda.df</pre>
```

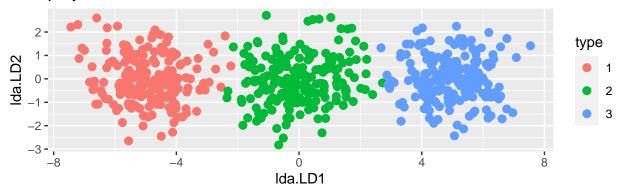

```
## Call:
## lda(factor(class) ~ x + y + z, data = df)
```

```
##
## Prior probabilities of groups:
           1
## 0.3333333 0.3333333 0.3333333
##
## Group means:
## 1 1.910877 7.919929 5.883410
## 2 3.906692 7.942222 5.901631
## 3 5.998491 8.029468 6.010456
## Coefficients of linear discriminants:
            LD1
## x 2.4840633 -0.02966442
## y -1.2855751 -0.77831989
## z -0.9877422 1.62387594
##
## Proportion of trace:
## LD1 LD2
   1
##
Let us plot the projections on LD1 and LD2
# prediction on df to get projections
predmodel.lda = predict(lda.df, data=df)
# projections with LDA classes
estclass <- as.factor(apply(predmodel.lda$posterior, 1, which.max))</pre>
newdata2 <- data.frame(type = estclass, lda = predmodel.lda$x)</pre>
p1 <- ggplot(newdata2) +
        geom_point(aes(lda.LD1, lda.LD2, colour = type), size = 2.5) +
        ggtitle("projections with LDA classes")
# projections with true classes
newdata <- data.frame(type = df$class, lda = predmodel.lda$x)</pre>
p2 <- ggplot(newdata) +
        geom_point(aes(lda.LD1, lda.LD2, colour = type), size = 2.5) +
        ggtitle("projections with true classes")
ggarrange(p1,p2,
          nrow=2)
```

projections with true classes

SIR

Now we use the SIR (Sliced Inversion Regression) in the dr package

```
# default fitting method is "sir"
help(dr)

dr_res <- dr(class ~ x + y + z, data = df, method='sir')

dr_res

##

## dr(formula = class ~ x + y + z, data = df, method = "sir")

## Estimated Basis Vectors for Central Subspace:

## Dir1 Dir2 Dir3

## x -0.8374295 -0.0164710 0.00380392

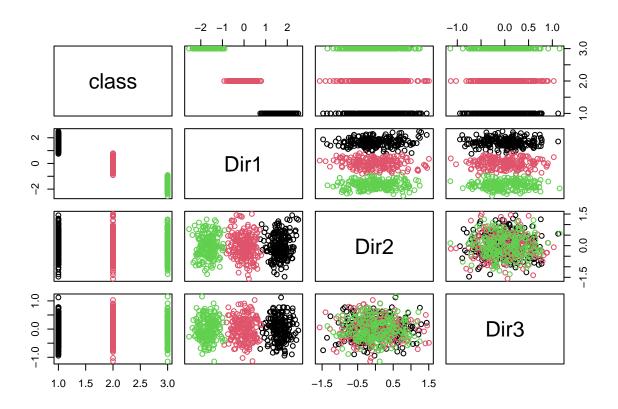

## y 0.4333941 -0.4321576 -0.81462206

## z 0.3329885 0.9016477 0.57997968

## Eigenvalues:

## [1] 9.424499e-01 4.902462e-04 2.616200e-17

plot(dr_res, col=df$class)</pre>
```

```
##
